

Out-of-region replication · two basins, opposite coda facies

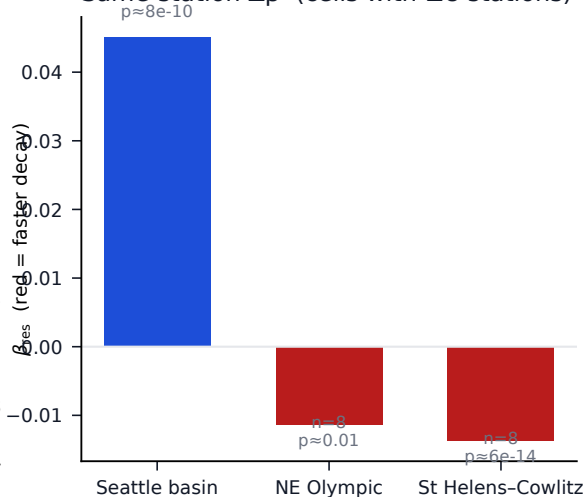

a

Cascadia replica β_{res}

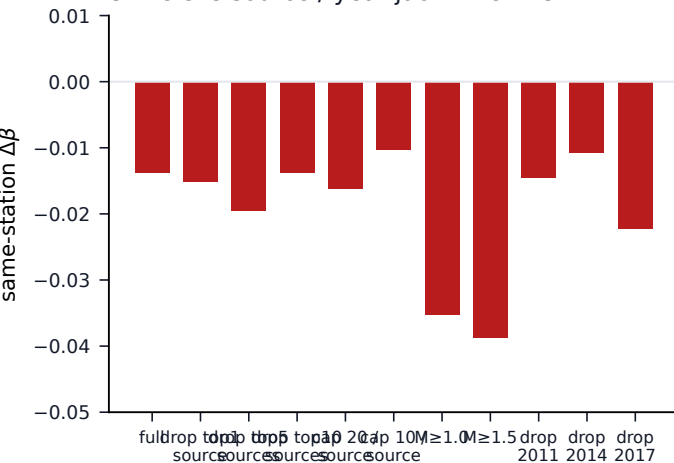

b

Same-station $\Delta\beta$ (cells with ≥ 8 stations)

c

St Helens source / year jackknife · STABLE

d synthesis: absorbing vs ringing paths

ABSORBING

Salton-Imperial
Mt St Helens-Cowlitz
 $\Delta\beta < 0$
faster coda decay
same stations, other paths

RINGING

E. Transverse Ranges
Seattle basin
 $\Delta\beta > 0$
energy persists
same stations, other paths

Same crust. Three observables.

- Berg Vs — split (same velocity band)
- Lin QS — orthogonal / anti-aligned
- Coda facies residual — station-controlled and replicated outside SoCal.

Prediction: new SCSN Salton-cell paths
site-median $\Delta\beta \leq -0.02$ ($n_{st} \geq 8$).
